Basic MEAN stack coding test

Create a basic full stack MEAN application that enables users to browse restaurants in the neighborhood. The application needs to have the following:

- A user interface that enables adding a new restaurant users may find. The restaurant should have the following properties at minimum: [Name, Description, City, State, Cuisine, Rating (1-5)].

- A grid that lists the saved restaurants

- A REST-full service layer as a backend to the UI to read client input, server client requests and persist to the mongodb

- A mongo database persistence layer

Feel free to exercise your creativity and style at any level. Adding testing code is a bonus.
